

Installing Node

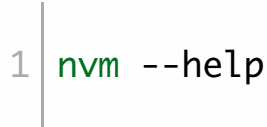

You can use [nvm](#) to install and manage Node on your machine. Copy the install script and run it:

```
1 curl -o- https://raw.githubusercontent.com/creationix/nvm/v0.30.1/in
```

A terminal window with a light gray background. The first line shows a green prompt character followed by the command 'curl -o- https://raw.githubusercontent.com/creationix/nvm/v0.30.1/in'. The terminal has a scrollbar on the right side.

After that, make a new terminal window and make sure that it is installed, by running:

```
1 nvm --help
```

A terminal window with a light gray background. The first line shows a green prompt character followed by the command 'nvm --help'.

Now you can use `nvm` to install Node `0.12.9` by running:

```
1 nvm install 0.12.9
```

A terminal window with a light gray background. The first line shows a green prompt character followed by the command 'nvm install 0.12.9'.

After that, nvm is going to load version 0.12.9 automatically. If it doesn't, you can load it in the current shell, with:

```
1 nvm use 0.12.9
```

A terminal window with a light gray background. The first line shows a green prompt character followed by the command 'nvm use 0.12.9'.

Note that you can load any node version in the current shell with `nvm use 0.x.y` after installing that version.

Also note that if you want to make `0.12.9` the default Node version on your machine, you can do so by running the following:

```
1 nvm alias default 0.12.9
```

A terminal window with a light gray background. The first line shows a green prompt character followed by the command 'nvm alias default 0.12.9'.

Then you can verify that it is the default version by making a new terminal window and typing `node -v`.

Permissions

Never use `sudo` to install packages, never do `sudo npm install <package>`. If you get permission errors while installing without `sudo`, you can own the folders instead. So for example, if you get an error like:

```
1 | Error: EACCES, mkdir '/usr/local'
```

you can own the folder with:

```
1 | sudo chown -R `whoami` /usr/local
```

You can own folders until Node doesn't complain.

Installing `live-server`

Install a package to verify that node is installed and everything is wired up correctly. We are going to use `live-server` through the book. So let's install that with:

```
1 | npm i -g live-server
```

Then, you should be able to run `live-server` in any folder to serve the content of that folder:

```
1 | mkdir ~/Desktop/sample && cd $_  
2 | live-server .
```
