## **Notes**

- The book assumes that you are working in a Unix-like environment. If you are on Windows you can use Cygwin so that you can follow along with the bash terminal commands.
- All the project files for the book are hosted on github: https://github.com/st32lth/angular2-intro. You can clone the repository and check out the project files. Throughout the book, you will see references to the project files. Those refer to this repository. For example,

  angular2-intro/project-files/hello-angular refers to the hello-angular folder inside the project-files folder.
- Make sure you have git installed on your machine. That is, make sure you get an output
   for git --version.
- The book assumes that you have a working knowledge of JavaScript and Angular 1.x
- Node is heavily used throughout the book. Make sure that you follow the "Node" chapter to install Node and set permissions correctly.
- All the keyboard shortcuts are mac-based. But if you are using a non-mac machine, you can almost always replace <code>command</code> with <code>ctrl</code> and you should be good. For example, if you a see a shortcut like <code>command + shift + b</code>, you can use <code>ctrl + shift + b</code> where <code>ctrl</code> is obviously the <code>control key</code>.
